1 RRAM Relaxation 1/f Fitting

This notebook contains the fitting for 1/f RRAM relaxation data across three technologies (A, B, C). It loads and processes the measurements taken for each technology to enable fitting and understanding of the data.

```
[]: # Imports
import gzip
import json
import matplotlib.pyplot as plt
import numpy as np
import pandas as pd
import scipy.signal
import scipy.stats

%config InlineBackend.figure_format = 'svg'
```

1.1 Load the technology and its settings

Below, choose which technology to load data and settings for:

```
[]: # Choose technology here
TECH = 'B'

# Load settings for technology
with open(f"data/tech{TECH}/settings.json") as sfile:
    settings = json.load(sfile)
```

1.2 Load the conductance data vs. time

Here, we will load the full dataset of conductance over time at room temperature to look at the 1/f behaviors of cells.

```
[]: # Load data for technology
colnames = ["addr", "time", "r", "g"]
data = pd.read_csv(f"data/tech{TECH}/relaxdata.tsv.gz", names=colnames,
→sep='\t')
data = data[data["addr"] % 2 == 0] # use only even addresses (odd addresses
→have weird behavior due to 2T2R architecture)
```

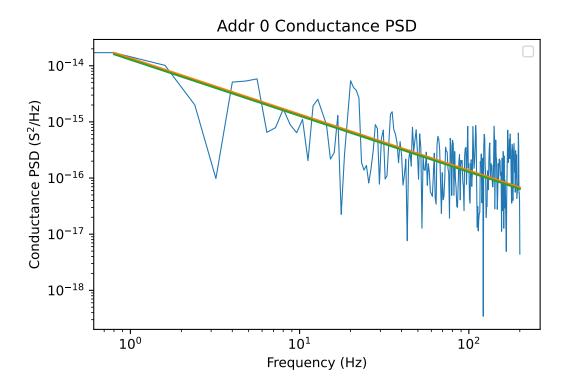

```
\hookrightarrow t=0 for each addr
     data["gi"] = data.groupby("addr")["g"].transform("first") # get initial_
     → conductance each addr was programmed to
     data["range"] = np.int32(data["gi"] / settings["gmax"] * 32) # get initial_
      →conductance range each addr was programmed to
     data.head()
[]:
